Environmental Policy

Humac Group applies their Environmental Management System to all aspects of its operations.

As owner and Director of Humac Group I have committed the Company to the principles of environmental sustainability and pollution prevention. I ensure that the organisation conducts all operations in an environmentally responsible manner and actively considers the impacts of climate change on, and from, our business activities.

The Company has adopted the International Environmental Management Standard ISO 14001:2015 as the framework by which it controls and continually improves its environmental performance. This includes understanding and addressing the risks and opportunities associated with climate change, both in terms of organisational impact and contribution.

We maintain a transparent and accountable approach to our environmental performance. This policy and other relevant information are freely available to stakeholders and the public.

This policy applies to all operations, regardless of whether they are located in remote or high-density areas.

Our Environmental Commitments:

1. Contribute meaningfully to environmental protection and sustainability by minimising waste, promoting recycling, preventing pollution, and respecting natural ecosystems.
2. Integrate consideration of climate change risks and opportunities into our business strategy, operations, and environmental planning processes.
3. Identify and assess the organisation's environmental aspects, including those related to greenhouse gas emissions, energy use, and climate resilience, and take action to mitigate adverse impacts.
4. Continually improve our environmental management system by evolving procedures and adopting technologies that enhance environmental and energy efficiency.
5. Incorporate environmental and climate-related considerations into all business decisions and project planning.
6. Take proactive steps to prevent environmental harm and maintain effective emergency response procedures to mitigate adverse effects.
7. Ensure compliance with all applicable legal and other obligations relevant to our environmental aspects, including those addressing climate change adaptation and mitigation.
8. Establish measurable objectives and targets related to environmental performance and emissions reduction, in line with this policy.
9. Regularly review our environmental performance and context to ensure our system remains relevant to our operations, stakeholder expectations, and changing environmental conditions, including those driven by climate change.
